Omaha, NE

Feb. 8, 2010 – PAXUS LLC, a global leader in payment processing software, conducted a live demonstration of their Dynamic Suite of Product’s total platform portability. In this live demonstration to a prospective client, PAXUS LLC engineers showed Dynamic’s portable software written to the Dynamic Plug-in Architecture (DPA) can be moved between Windows and HP NonStop operating systems. A software plug-in was developed using DPA that manipulated various fields in a financial transaction. The plug-in was compiled and deployed to a Microsoft Windows platform. The same source code was compiled and deployed to the HP NonStop operating system platform. The same test transactions were sent to each platform where detailed financial information was displayed to show before and after results of the test financial transaction. This live demonstration shows the versatility of the Dynamic product line and how total portability is accomplished in today’s payment processing environments.

Damian De Rozairo, CTO of PAXUS LLC comments, “This portability opens options for companies to make strategic cost-effective platform choices with total confidence their software using the Dynamic product line will continue to perform at the highest levels”.

About PAXUS LLC.
